Serrated Soft Top Jaws

60° SERRATIONS

Material:

- Steel: 080M15 (En32) • Black Finish
- Aluminium: HE30TF • Natural Finish

Chuck Ø 450mm - 800mm

IMPORTANT: Allow for weight of Large Diamond/Segment Jaws at high R.P.M.'s as the grip loss due to the effect of centrifugal forces will be greater.

Diamond/Segment Jaws

- Can be turned or bored to clamp entire circumference of workpiece
- Choice of steel or aluminium types
- Diamond Jaws have greater flexibility than segment jaws, can be reversed
- Aluminium jaws – less weight for higher spindle speeds
- Helps stop distortion of thin walled components
- Can be machined to suit irregular parts

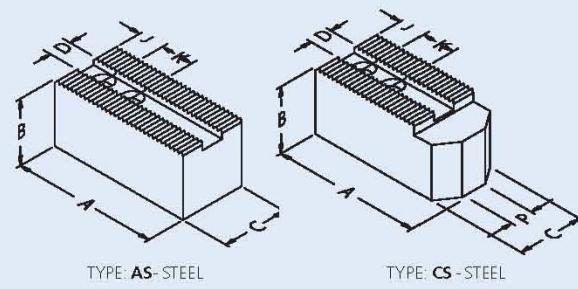

**Distortion problems can be solved by using
Diamond/Segment Jaws**

Serrated Soft Top Jaws

60° SERRATIONS

Material:

- Steel: 080M15 (En32)
- Black Finish

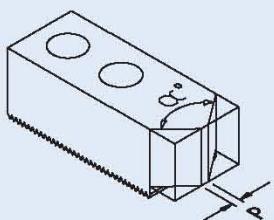

**To suit • Howa HO1MA Chucks (3mm Serrations)**

Pointed or weight reduced soft jaws

A. Pointed 60° or 120° Inclusive ∞°

B. Rectangular Weight Reduced

Any standard soft jaw can be pointed or weight reduced, please give following information:-
1. Quantity of sets required.
2. Thame Part No.
3. Modification required.
4. Relevant dimensions.

HOWA CHUCK TYPRE

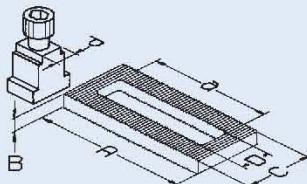

HO1MA6

HO1MA8

HO1MA10

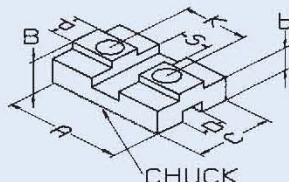

HO1MA12

Conversion plates

A. Serration to Serration

Allows different top jaws to be used with base jaws of another configuration.
 Please contact our sales office for a quotation.

B. Serration to Slot/Tenon

Adjustagrip Hard Top Jaws

Adjustagrip hard jaws are designed to provide maximum grip during 1st operation workholding applications- these jaws allow increased feed rates, depth of cut and reduce cycle times, compared to using standard hard reversible or soft jaws.

Ideal for rough castings and raw stock material.

- The serious Hard Jaws for heavy machining.
- One set will grip various gripping diameters
- Clamping depth varied by a range of height pins
- Six Radial gripping teeth per jaw for high transmission and greater safety
- Lightweight design allows higher RPM's giving more grip
- Made with alloy steel for strength and durability
- External or Internal Gripping styles & Bar Jaws available
- Proven product over 20 years in the market
- Stock or short delivery for standard ranges

Inogrip
Jaws

Inogrip Jaws - High Precision Clamping

What's different about clamping with Inogrip Jaws?

Inogrip Jaws secure the workpiece by locking their precise tooth form into defined pre stamped identical indentations on the workpiece. This creates a positive locking between the workpiece and the clamping jaws giving an exceptionally secure holding force. The tooth form also has a depth register which provides an absolute precise reference; thus enabling workpieces to be re-inserted into the jaws with an accuracy of up to $\pm 0.005\text{mm}$. Stamping can be done on the clamping chuck or preferably at a separate stamping unit. All materials with a consistency of up to $1,400\text{N/mm}^2$ can be stamped.

Examples

Bearing Sleeve

Sealing Ring

Housing

Material :	ST52	16MnCr5	Aluminium
Outside Ø :	152mm	175mm	180mm
Clamping Depth:	6mm	6mm	10mm
Clamping Force:	1.5kN	7kN	3kN
Surface Speed:	180m/min	180m/min	250m/min
Feed Rate:	0.25mm	0.25mm	0.40mm
Depth of Cut:	3mm	2.5mm	3.5mm
Tolerance Achieved:	< 0.03mm	0.009mm	0.02mm

What are the Advantages of using Inogrip Jaws?

Firstly low distortion - because the holding method is so secure, less chuck pressure is needed to hold the workpiece. Typically chuck pressure can be reduced to one tenth of normal requirement, this means greatly reduced distortion on thin walled parts.

Fewer machining operations - lower distortion means improved roundness of bores and turned diameters so that a final turning or grinding operation can be avoided. One jaw set can be used for both roughing and finishing. The stable holding of the workpiece reduces vibration and therefore improves the finishing quality.

Costly material saved - workpieces only require to be clamped on 6mm for a stable and secure hold compared to the 20-25mm required with other chuck jaws. This results in substantial material cost savings per piece.

High repeatability - the precise indentations allow the part to be removed from a chuck and re-inserted exactly opening up the possibility of other operations such as milling and measurement being added to the process.

High performance - the accuracy and exceptionally secure grip allows the process to be used on all round workpieces at optimum operating levels giving a lower cost and higher quality per part.

Multi-Point Rocker Jaws

Multi-Point Rocker Jaws are designed for clamping thin walled workpieces that are often deformed when clamped with conventional width jaws on a power chuck. They lower the deformation of the workpiece by spreading the clamping force equally to six or twelve clamping points on its perimeter. The floating rocker arms allow the part to self centre thus overcoming irregularity in castings and forgings as the part is clamped.

Thame Workholding's standard design of Rocker Jaws covers many applications and each assembly comes complete with a Master Base Jaw, Pivot Bolt, Rocker Arm and Serrated Grip Inserts.

A set of Multi-Point Rocker Jaws will cover a specific range of clamping diameters whilst the depth of grip can be varied by using our standard height pins.

Using Multi-Point Rocker Jaws will assist in obtaining the best possible machined roundness on diameters and bores improving any out round to an acceptable level.

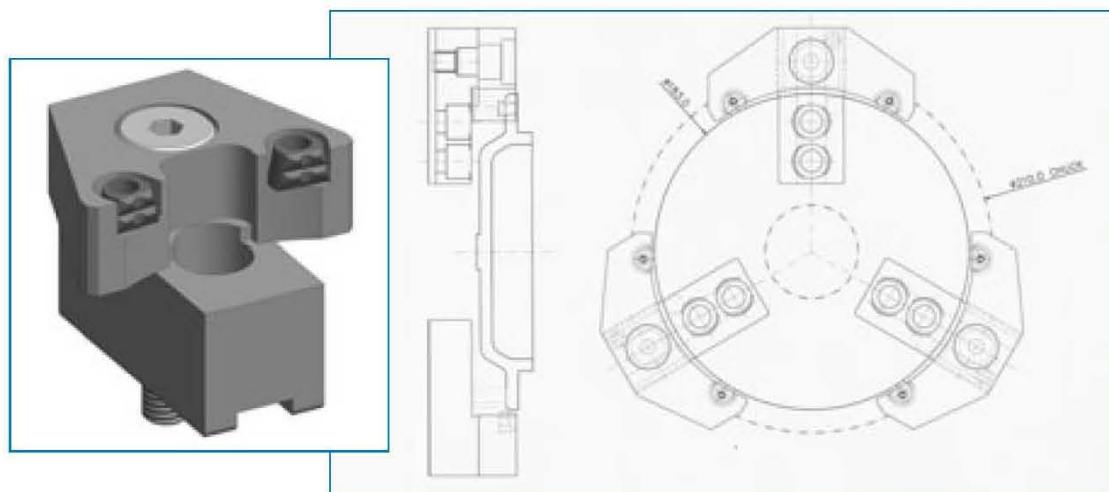

Multi-Point Rocker Jaws can improve deformation from hundreds of microns down to a single figure digit in some cases.

Soft inserts or segments can also be used to allow second operation work with the rocking arms fixed.

We manufacture and design Multi-Point Rocker Jaws to suit all types of chucks including large vertical chucks up to 3 metres.

Standard Design

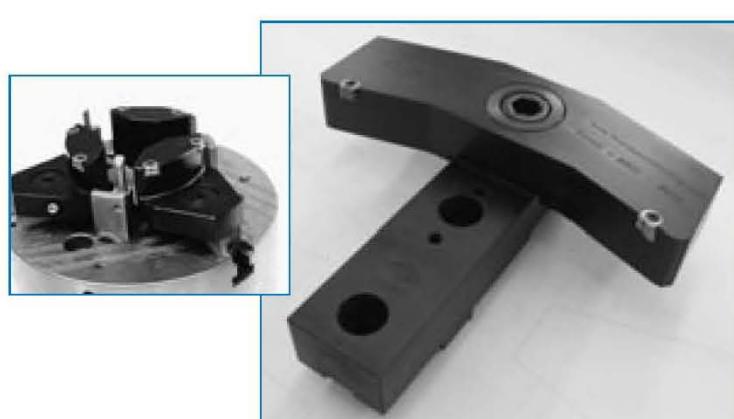

Available to suit a wide range of chucks contact our sales office for more information.

Thame Specialist
Jaws & Services

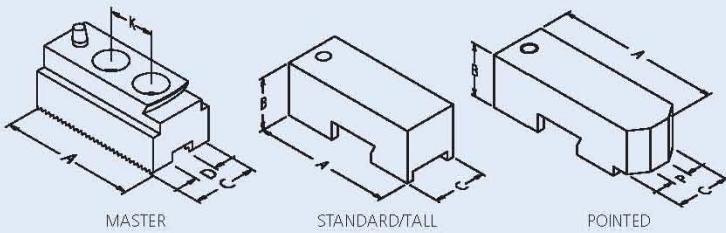

Special Design

We will design Multi-Point Rocker Jaws to suit your workpiece they could be six or twelve point contact jaws with all the necessary stops and location needed to clamp your part and reduce the out of roundness to an acceptable level. These are usually first operation jaws but provision for a second operation could also be possible.

Quick Change Soft Top Jaw System

- High Repeatability (0.020mm)
- Stable & Secure System
- Low profile Master Jaw
- Large Clamping Range Possible
- Changed in Seconds
- Other types available to order

To suit • 1.5mm x 60° Metric Serrated Power Chucks

The TEC Quick Change Jaw system consists of a hardened intermediate jaw, which is mounted to and normally stays on the chuck base jaws. This intermediate jaw has a unique mounting for inexpensive top jaws. A set of top jaws can be exchanged for a different set in a few seconds with only the simple push of a button. Jaws can be quickly interchanged with high levels of repeatability so providing all the advantages of a quick-change chuck but at a fraction of the cost.

Tri Square Top Jaws

For clamping square section on a 3 Jaw Chuck

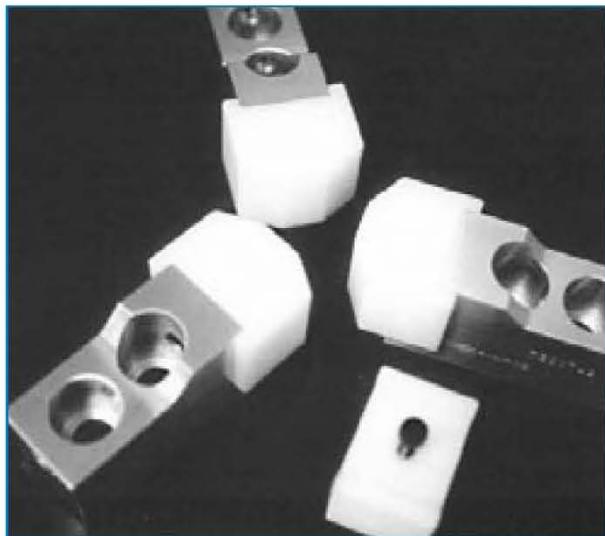

Tri Square top jaws are adjustable hard top jaws used on three jaw chucks to clamp a range of square section. This simple but clever top jaw system removes the need in many instances to use 2 or 4 jaw chucks for the clamping of square section. Tri Square top jaws are ideal for clamping a series of square parts of different size because of the quick and easy adjustment from one size to another. Tri Square top jaws allow more universal use of three jaw chucks allowing the clamping of square and round section - when using chucks as fixtures horizontally on machining centres this can save costs on special fixtures.

Tri Square jaws are made to order to suit your chuck type and range of section size. Special shaped jaws can also be designed to suit irregular, rectangular and polygonal shapes.

Insert Systems

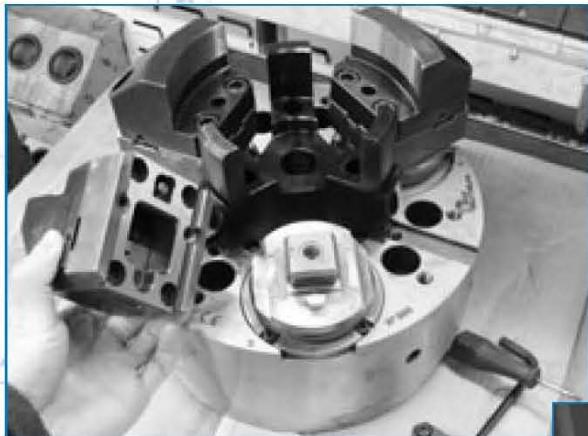

Plastic or aluminium inserts for gentle clamping

The use of inserts in a softer material can be an advantage when you need to clamp machined diameters during finishing operations. In this instance we offer to supply a range of plastic or aluminium inserts either standard width or wide to leave no marks when you clamp the workpiece.

The support jaws can be steel or aluminium depending on the application and can be for serrated or slot and tenon style chucks. This method of clamping is often used to hold fragile parts that would be marked or distorted in steel jaws.

Design and Manufacture of Special Jaws

In house Design

In a perfect situation all applications would be covered by standard chucks and jaws, in reality to get the best performance or because it is technically impossible to hold the workpiece with standard products it is often necessary to use specifically designed chucks and jaws. This is where Thame ask you to let our specialist design engineers look at your problem and offer the optimum chuck and jaw solution. We will analyse your equipment and manufacturing operations to develop a specific recommendation to suit your workpiece.

Special Jaws

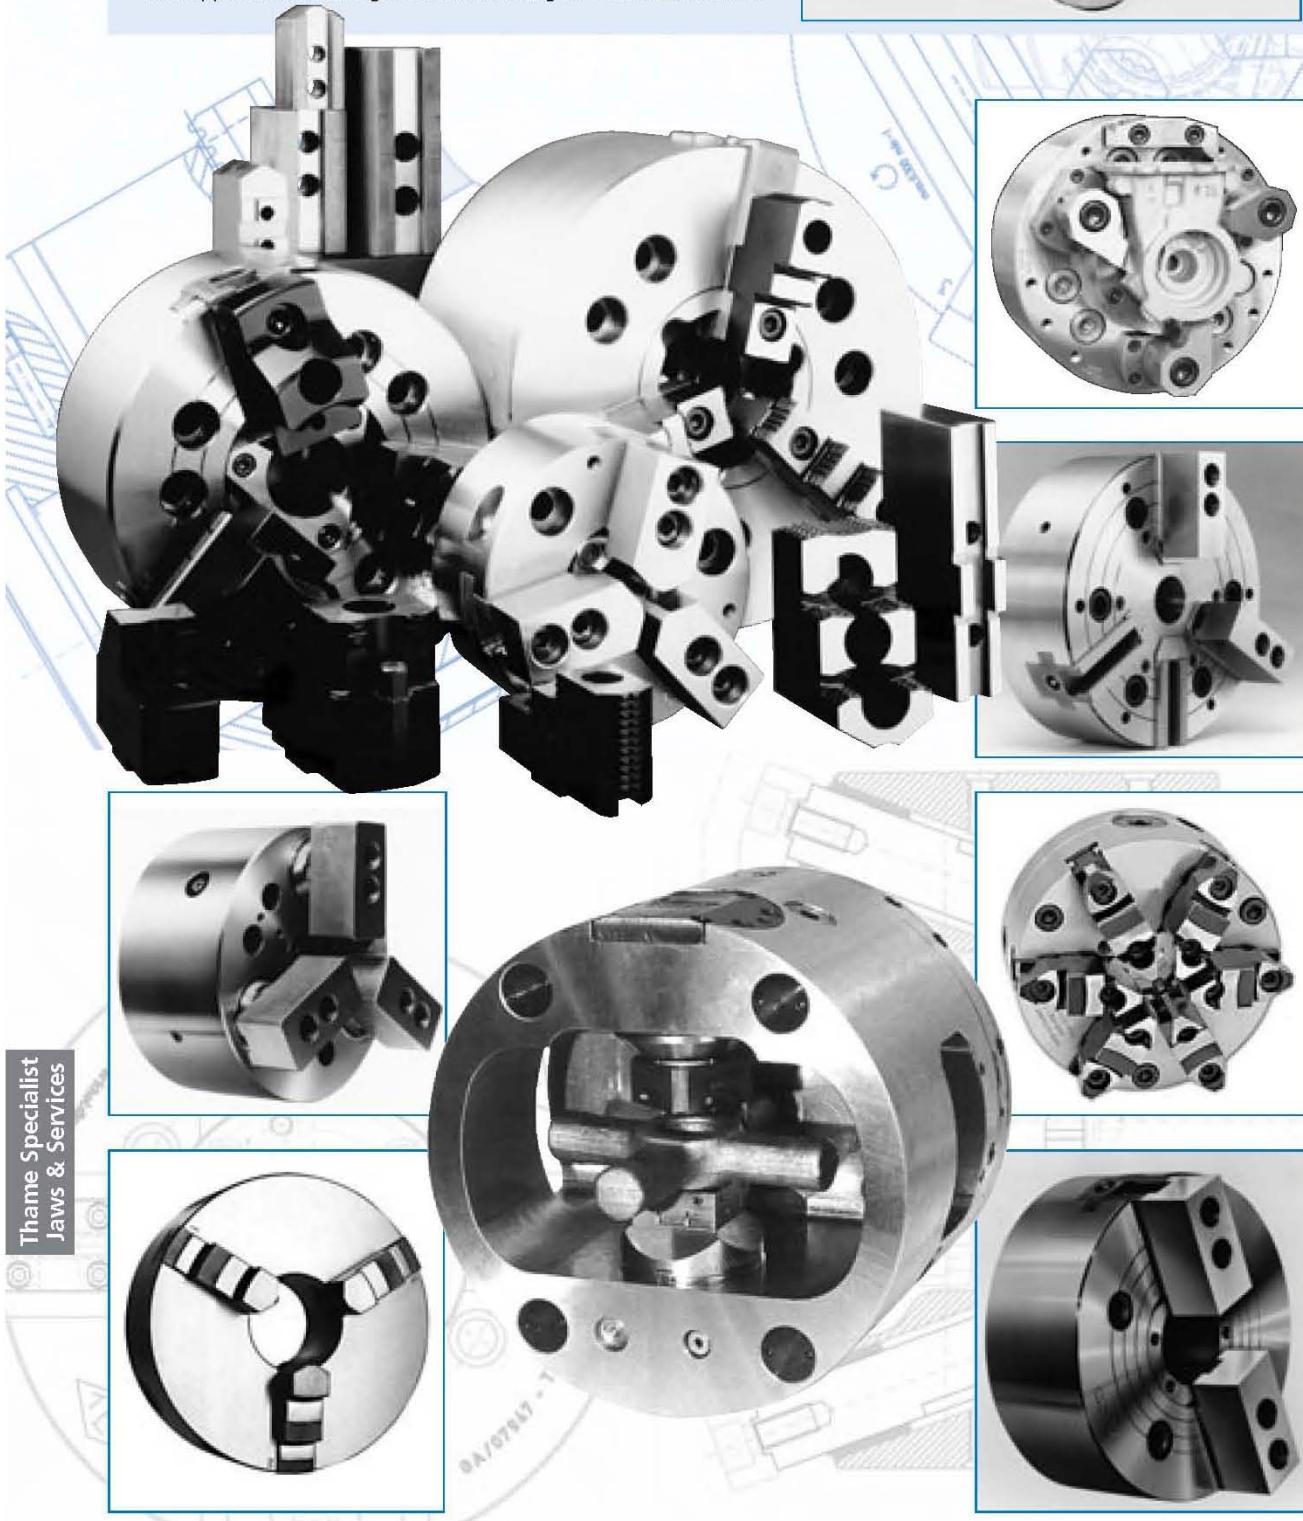

We have over thirty years experience and know-how in the design and manufacture of special jaws. Every year we design and produce hundreds of innovative solutions to help our customers increase their productivity. This specialist knowledge is at your disposal, please try our service and join the large number of our customers who return time and time again because they are satisfied with the end result.

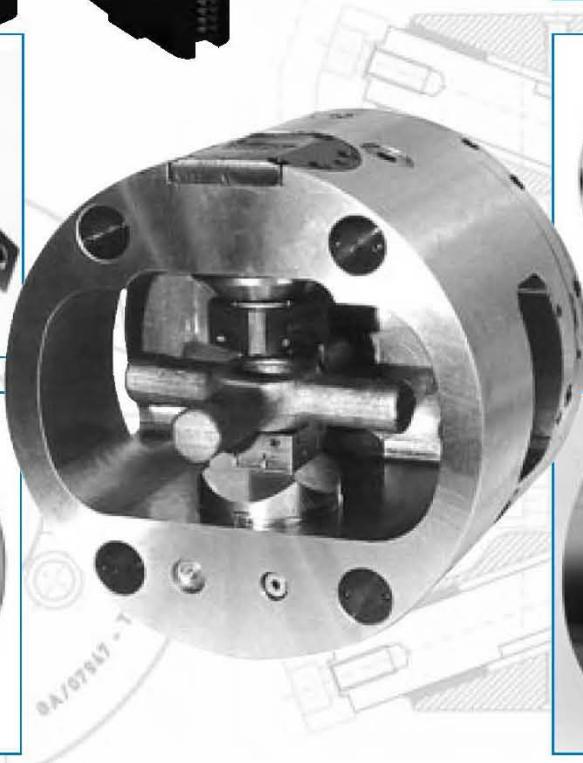

Thame Specialist
Jaws & Services

Replacement Chucks and Special Chucks

Manual and Power Chucks, including retro-fit systems to suit most applications. We will design, supply and fit complete packages – top tooling, chuck, adaptors, draw-tube/bar, connectors, cylinders and all ancillary products. We also design Special Chucks for customers to suit their application including Pull Back, Indexing and Eccentric Chucks.

PART No.	A	B	TAPPED
EU 7A	12.7	9.5	M6

- Carbide gripping faces for long life
- Cost effective—just replace insert when worn
- Diamond point gripping serrations for positive grip
- Can be used with special jaws or soft jaws

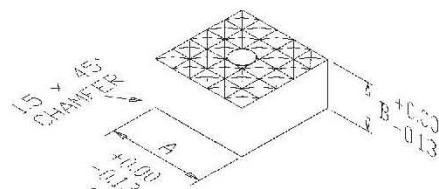

Gripper inserts are retained by either set screw from side to flat on o.d. of gripper or by cap screw from back.

Square Design

PART No.	A	B	TAPPED
EW 40	12	10	M5 x 0.8

- Hardened tool steel grips for high shock load when loading or unloading.

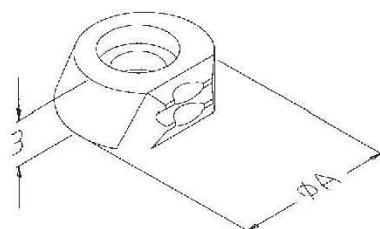

Replaceable Gripper Inserts

Suitable for Chuck Jaws and Fixtures

Hardened High Speed Steel - O.D. Grip Design

Inclusive of socket head screw

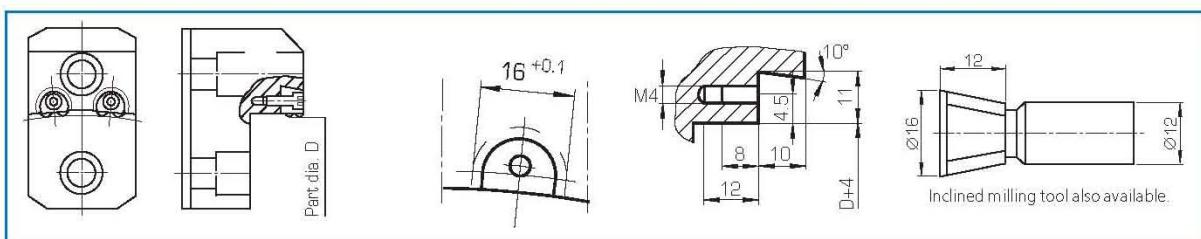

- Unique shape for OD or ID Gripping.
- Top mounting of bolt.
- Can be used for self-centering or pivoting.
- Pull down effect by wedge shape design.
- Inclined cutter easily machines seating pocket.

PART No.	A	B
EZ 05	16	10

Mounting Instructions:

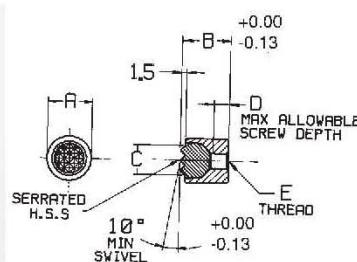

1. Part Ø + 4mm (0.16 inch) + seat turning or milling.
2. Milling of pocket + drilling and tapping.

Pivoting Gripper Ball Units

Suitable for Chuck Jaws and Fixtures

Serration Cleaning Plate

Serration plates are available in three standard types, each supplied in a wooden case with a tube of lapping paste.

- Allows quick and easy cleaning and deburring of serrated chuck jaws.
- Improved accuracy of mounting to base jaws.
- Extends the working life and precision of the top jaws.
- Keeps jaw serrations in perfect condition.
- Different serration type on both sides of the plate.

Simply apply lapping paste and guide jaw onto serrations on plate, move jaw back and forth until serrations are in top condition.

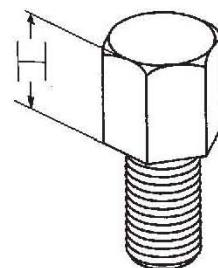

PART No.	SERRATION TYPE
ES96	1/16" x 90° and reverse 1.5mm x 60°
ES99	1/16" x 90° and reverse 3/32" x 90°
ES66	1.5mm x 60° and reverse 3mm x 60°

Workpiece Height Pins

- Material En32 Hardened & Ground
- Workpiece Height Pins are for use with Adjustagrip hard jaws or special jaws requiring a workpiece height location.

Height Pins of a different height or Thread are available on request.

Trueborer

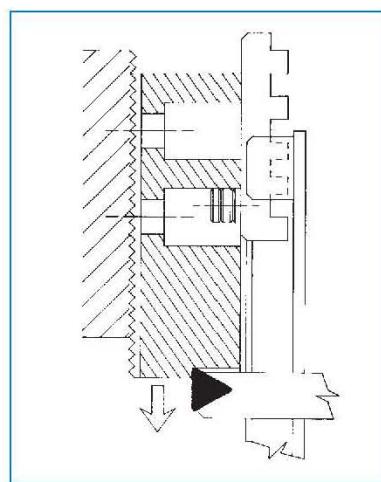

Jaw Boring-Turning Fixture for Power Chucks

Available in three sizes to cover chuck diameters from 125mm up to 600mm.

- Quick clamping of top jaws to produce a perfectly concentric bores or turned diameters
- Allows jaws to be bored or turned at the same clamping pressure required to hold the workpiece
- Only one operation even if through boring jaws
- Saves on jaw usage because of the adjustment allowing minimal skimming of jaws
- No time wasted looking for, or turning clamping rings
- One Trueborer can be used on many chucks
- For grinding, boring or turning of soft or hard top jaws

PART No.	BEST SUITED FOR CHUCK DIAMETER	RING INTERNAL DIAMETER	RING EXTERNAL DIAMETER	JAW BOLT DIAMETER RANGE	BOLT DIAMETER	WEIGHT Kg	MAX. CLAMPING PRESSURE
ES16	125-200	100	180	30-250	13 & 16	4	8000 da N
ES25	250-315	195	295	100-340	16	10	10000 da N
ES42	400-600	310	420	180-550	18.5	20	13000 da N

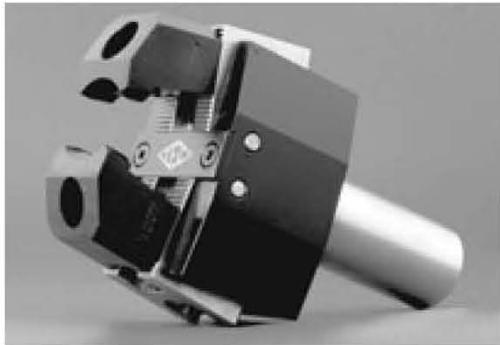

Operation

- A. Set top jaws on chuck master jaws to obtain required clamping diameter.
- B. Rotate the back plate on the trueborer to position the jaw slides so the boltheads can be inserted into the counterbore holes of the top jaws (make sure the bolts are in the correct hole on the slides).
- C. When in position continue to turn the backplate clockwise for boring or anti-clockwise for turning until it stops and is held tight and parallel against the top jaws.
- D. Clamp up chuck, Trueborer will hold jaws in required position of chuck stroke to bore or turn jaws under pressure.

The easiest way to bore or turn Soft Jaws

Powerpull Bar Puller

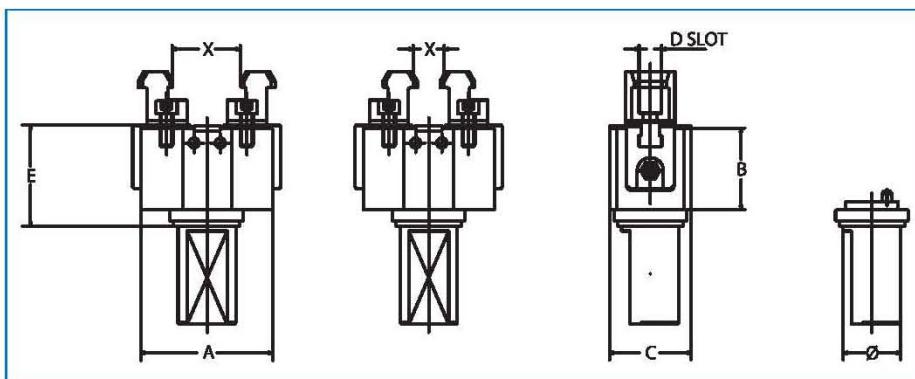

- Two body sizes
- Bar capacity 6 - 90mm
- Adjustable gripping pressure
- Robust construction
- Unit supplied with one pair reversible gripping jaws
- Choice of plain or VDI shank

The Powerpull Bar Puller is for use on CNC or Automatic Lathes with an interchangeable tool turret. It is designed to pull bar stock and tubes into position for machining purposes, thus giving the ability for unmanned operation, without the expense and room needed with a bar feeder. The Powerpull is a two-jaw lever chuck with variable tensioning jaws which cater for most types of material. It comes in two body sizes each with one set of reversible clamping jaws. This easy to set Bar Puller has adjustable gripping pressure and comes with a choice of standard plain or VDI shanks. Special jaws can be designed and manufactured to suit unusual applications.

PART No.	BODY DATA							GRIP RANGE X	PLAIN SHANKS	VDI SHANKS	CLAMPING FORCE kN	
	A	B	C	D	E	F	U				MIN	MAX
ER 04	85	49	50	11	59	M8	2.5	6 - 36	32 Dia.	30 Dia.	1,30	1,70
								34 - 64	40 Dia.	40 Dia.		
ER 06	120	60	60	14	72	M10	3	6 - 60	32 Dia.	30 Dia.	2,00	2,70
								50 - 90	40 Dia.	40 Dia.		

Technical Data

Powerfull on turret pulling bar into postion

Operating Description

The bar stock is initially fed manually through the machine's hollow spindle to a fixed stop, the bar is then clamped by the spindle mounted chuck or collet and machining sequence completed. The Powerpull mounted in the turret is brought towards the headstock and the jaws of the Powerpull are forced over the bar clamped in the spindle chuck. The spindle chuck is then unclamped and the spring gripping jaws of the Powerpull grip the bar stock, enabling a positive bar drag out to a pre-determined stop position. The spindle chuck is then re-operated to clamp the bar and the turret is withdrawn further to release the jaws. The bar is then ready for the machining process to be repeated.

Technical Information

Jaw Location Dimensions

Chuck manufacturers often supersede or change specifications on jaw location details so it is important to check that the dimensions listed below correspond with your existing top jaws, master jaws and chuck.

Serrated Jaws

L = pitch & angle of serrations

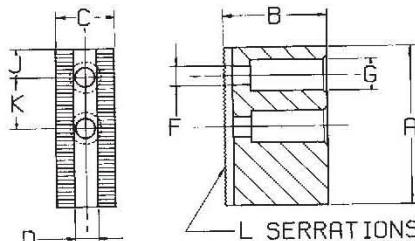

1.5mm x 60° ; 1/16" x 90°

3mm x 60° ; 3/32 x 90°

D = slot width (locates on t-nut)

K = Hole centre spacing

G = bolt hole (see note below)

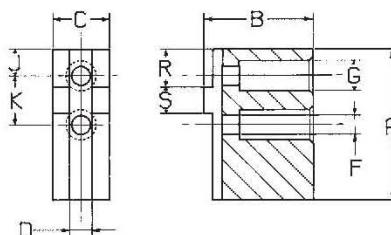

Slot & tenon Jaws

D = slot width

S = tenon width

K = hole centre spacing

G=bolt hole (see note below)

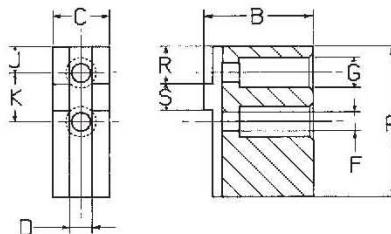

Scroll Jaws

C=jaw width

D=slot width

J=tooth pitch

Note: remember the bolt hole will have clearance on the bolt.

It is important that these dimensions are measured accurately. The use of a vernier or micrometer is recommended.

Please Note

Whilst every effort is made to make sure the information relating to technical data is correct, manufacturers do change specifications of their products and subsequently Thame Workholding shall not be liable for any loss or consequential damage whatsoever that may arise from the use of the products or the use of information or particulars in, or any error or omission in this catalogue. The responsibility of correct fit and use must lie with the user and the information in this catalogue only used as a guide.

Soft Scroll Jaws

Thame Workholding soft scroll jaws have been manufactured to allow for a small degree of wear in the chuck guide way, therefore the slots are slightly undersize and the width slightly oversize. A minor amount of adjustment may be required to obtain a correct fit, particularly if the chuck is new.

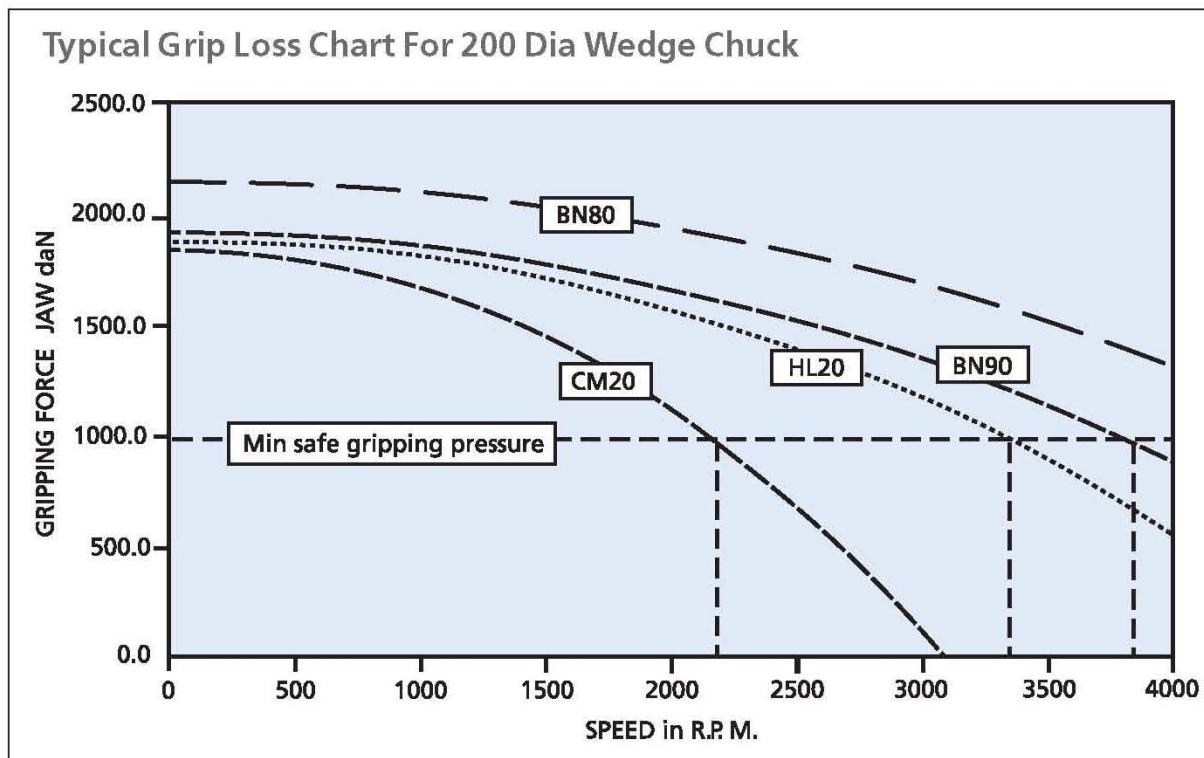

Concentricity

Thame Workholding manufactured standard hard jaws are made to a 0.05 – 0.07mm concentricity tolerance using our purpose made fixtures. For optimum concentricity jaws must be hard turned on the chuck in situ on the machine. Please Note: The condition of the chuck has a great bearing on concentricity and repeatability of jaw sets. Regular servicing of chucks will prolong their life and maintain a higher level of operating accuracy. For unparalleled concentricity when boring standard soft jaws a Thame Workholding Trueborer is recommended (see page 166).

Technical Information

Grip Loss Due To Centrifugal Forces

The following chart shows the typical grip loss for different types of standard jaws on a 200mm diameter wedge type chuck.

JAW CODE	JAW TYPE	JAW MATERIAL	WEIGHT PER JAW
BN80	Std. Soft Jaw	Mild Steel	0.93Kg
BN90	Tall Soft Jaw	Mild Steel	1.23Kg
CN20	Diamond Jaw	Mild Steel	4.66Kg
HL20	Diamond Jaw	Aluminium	1.66Kg

Conversion Factors: $1\text{kN} = 100\text{daN}$ $1\text{kgf} = 9.806 \text{ N}$

Typical Gripping forces (for external gripping) can be calculated using the following formulae.

For drawtube/bar operated chucks

$$G_f = S_f F_o / (1 + J_h G_h) - G_l S^2 (MR + B_j)$$

For pneumatically operated chucks

$$G_f = S_f P_o / (1 + J_h G_h) - G_l S^2 (MR + B_j)$$

Technical Information

Grip Loss Due To Centrifugal Forces

Where Gr= Chuck Gripping Force (daN)

Fo= Operating Force of drawtube actuated chucks in daN

Po= Operating Pressure of pneumatically actuated chucks in daN.

S = Speed of chuck in thousandths of R.P.M. (i.e. 6000 RPM = 6)

M = Mass of top jaw in Kg.

R = Radius of grip in cm

Gh= Height of top jaw in cm.

And Sf, Gf, Bj, Jh, & Pf are constant values associated with specific chuck types and typical values are found in the tables A,B, & C below.

Note: For internal gripping the centrifugal force is additive, the minus sign in the above formulae therefore becomes a plus sign.

Table A

For standard wedge type chucks

CHUCK SIZE	160	200	250	305	380
S _f	0.80	0.80	0.80	0.80	0.80
G _f	7.5	7.5	7.5	7.5	7.5
B _j	2.3	5.2	8.9	15.9	34.0
J _h	0.08	0.06	0.05	0.04	0.03

Table B

For Compensating chucks

CHUCK SIZE	160	200	250	305	380
S _f	0.75	0.77	0.91	0.91	0.80
G _f	8.0	8.0	8.0	8.0	8.0
B _j	-1.5	-4.2	-6.0	-11.5	-22.0
J _h	0.08	0.06	0.05	0.04	0.03

Table C

For Pneumatic chucks

CHUCK SIZE	160	200	250	305	380
P _f	173	256	380	462	473
G _f	6.2	6.2	6.2	6.2	6.2
B _j	2.8	5.3	10.2	15.9	19.6
J _h	0.075	0.070	0.055	0.040	0.045

Note: The above charts are typical examples only and should not be applied without consultation with chuck manufacturers or chuck manuals.

Technical Information

Materials

Most Thame Workholding standard jaws are manufactured from either 080M15 (EN32) low carbon steel or 590M17 (16MnCr5) alloy steel which can be case hardened for long term durability. Other materials can of course be used, for example more exotic steels, aluminium's, plastics and composites and these are all available as specials. T-Nuts are manufactured from EN24 heat-treated to the 'T' condition.

Below is a simple table showing British Standard and corresponding German reference numbers for various steels used in the production of Thame Workholding products.

MATERIAL	BS 970/83	BS 970/55	GERMAN
Steel	080M15	En32	C15
Steel	665M17	En34	
Steel	080M40	En8	C45
Steel	590M17		16MnCr5
Steel	817M40	En24T	40NiCrMo6

Unless otherwise stated all special jaws will be manufactured using the materials specified on the drawings supplied by the customers.

Heat Treatment

All Thame Workholding standard soft jaws can be case-hardened using heat treatment. See chart below for guidelines.

	Depth of Case	MATERIAL TYPE	
		080M15 (En32)	590M17 (16MnCr5)
Thin Section	0.38 – 0.5mm	54 - 56	57 – 59
Normal Section	0.63 – 0.75mm	56 - 58	58 – 60
Thick Section	0.76 – 1.00mm	57 - 59	59 - 61

Top Jaw Weights

Careful consideration must be given when fitting oversize top jaws to a rotating chuck because the safety and performance of the chuck will be compromised. Although the calculations given in the chart on page 169 can establish approximate theoretical grip loss, the most accurate method is to establish the actual performance of the jaws on the machine; this can usually be carried out by use of a grip meter.

Thame Engineering offer grip meter equipment for sale or hire and in either case full instructions for use and any advice required are included. Please contact our sales office for further details.

CE Regulations

The Supply of Machinery (Safety) Regulations 1992 became fully effective on the 1st January 1995 and in accordance with its requirements Thame Workholding will supply Declarations of Incorporation where necessary. It is possible that this legislation, or at least parts of it, will be amended in the future. As and when these changes occur Thame Workholding will make every effort to comply with these regulations.
